The pathologist must be able to recognize the morphologic
differences that exist among species, strains, and ages or
between genders (comparative neuroanatomy) and to grasp the
impact of structural damage on neural function (correlative
neuroanatomy). Brain anatomy and function may be used to
group the mammals used in neurotoxicity bioassays into 3
classes: rodent, carnivore, and primate.

Abstract In this chapter, we present correlative clinical neuroanatomy for neuroanesthetists. This is written with the aim of helping doctors cope with the ever-evolving field of neuroanesthesia while armed with a rock-solid foundation of anatomy that would help in maintaining safe clinical practices.

Disinhibition is considered a cardinal feature in the prefrontal syndrome, [1-3]. More specifically, the classical clinico-anatomical correlate of disinhibition is the orbitofrontal cortex (OFC) [1-3]. This appears to apply also to neurodegenerative diseases, where disinhibition is associated with OFC atrophy [4-6].
