Embedded system design is very challenging as it requires multi-disciplinary expertise in Hardware, Firmware and Software. Most of embedded systems developments ends up as a failed project or not delivering performance as planned initially. This can be address by proper planning and selection of suitable hardware and software components.

Many of these are implemented as embedded systems. Embedded designers are being asked more often to create systems that run reliably to the degree that they're in service 99.999% of the time (termed "five-nines" availability), which is equivalent to less than one second of downtime per day. These are called high availability systems.
