Study Guide Energy Work And Work. The concept of work in physics is much more narrowly defined than the common use of the word. Work is done on an object when an applied force moves it through a distance. In our everyday language, work is related to expenditure of muscular effort, but this is not the case in the language of physics. A person that holds a heavy object does no physical work because the force is not moving ...

Work and Energy
The work-energy theorem states that the net work done on an object is equal to the change in kinetic energy of that object. This is true as long as the work is only changing the object's speed (not storing potential energy, for example). Conservative and non-conservative forces ... About Uni Study Guides;

Use the work energy theorem to explain what happens to the work done on a box as it moves up a ramp: The amount of work done on an object is equal to the object's change in kinetic energy—As an object is pulled up an incline with friction, some of the work done on the object is converted into potential energy while the rest is lost as heat energy.

Unit 7: Work, Power, and Energy Lesson 7.4 Kinetic Energy Introduction In the previous lessons, you saw how forces do work on objects. Forces can either transfer energy to or from an object. A race car can accelerate at high speeds utilizing a pushing force coming from its engine. You can also say that the engine transfers energy to the race car. This energy is called kinetic energy.

The gravitational potential energy (there are many types of potential energies) is measured as 'mgh'. mg is the weight/force and h is the distance. The product is nothing but the work done. Even kinetic energy is a simple deduction from the laws of linear motion. Try substituting for v^2 in the formula for kinetic energy. Variables

The unit of work is a newton-meter, or a kg·m²/s²—exactly the same as a joule. When a force acts over a distance, it changes the kinetic energy of the object it acts on. This is known, creatively, as the work-energy theorem and can be expressed by an equation. Here v f is the object's final velocity and v i its initial velocity.
